

Protocol for the Examination of Biopsy Specimens From Patients With Carcinoma of the Ureter and Renal Pelvis

Version: 2.3.0.0

Protocol Posting Date: September 2023

The use of this protocol is recommended for clinical care purposes but is not required for accreditation purposes.

This protocol may be used for the following procedures AND tumor types:

Procedure	Description
Biopsy	Includes specimens designated biopsy or endoscopic transurethral resection
Tumor Type	Description
Carcinomas	Includes invasive carcinomas of the urinary tract, including urothelial carcinoma, its morphological subtypes, and other carcinoma (such as squamous cell carcinoma, adenocarcinoma, Müllerian carcinoma, neuroendocrine carcinoma)

The following should NOT be reported using this protocol:

Procedure		
Resection (consider the Ureter a	and Renal Pelvis Resection protocol)	
Cytologic specimens		

The following tumor types should NOT be reported using this protocol:

Tumor Type

Lymphoma (consider the Lymphoid Neoplasm protocols)

Sarcoma (consider the Soft Tissue protocol)

Renal cortical and medullary tumors (consider the separate Kidney protocol)

Authors

Lara R. Harik, MD, FCAP*; Gladell P. Paner, MD, FCAP*; Hikmat A. Al-Ahmadie, MD; Robert W. Allan, MD; Peter A. Humphrey, MD, PhD; Jesse K. McKenney, MD; James M. McKiernan, MD; Semra Olgac, MD; Priya Rao, MD; Maria Rosaria Raspollini, MD, PhD; John R. Srigley, MD.

With guidance from the CAP Cancer and CAP Pathology Electronic Reporting Committees. * Denotes primary author.

Accreditation Requirements

The use of this case summary is recommended for clinical care purposes but is not required for accreditation purposes. The core and conditional data elements are routinely reported. Non-core data elements are indicated with a plus sign (+) to allow for reporting information that may be of clinical value.

Summary of Changes

v 2.3.0.0

- WHO 5th Edition update to content and Explanatory Notes
- LVI question update from "Lymphovascular Invasion" to "Lymphatic and/or Vascular Invasion"

Reporting Template

Protocol Posting Date: September 2023 Select a single response unless otherwise indicated.

CASE SUMMARY: (URETER, RENAL PELVIS: Biopsy)

Standard(s): AJCC-UICC 8

This case summary is recommended for reporting biopsy specimens, but is not required for accreditation purposes.

SPECIMEN

Specimen (Note A)

- ____ Renal pelvis
- ____ Ureter
- ____ Other (specify): _
- ____ Not specified

Specimen Laterality

- ____ Right
- ____ Left
- ___ Not specified

TUMOR

Histologic Type (Note <u>B</u>) (select all that apply) Urothelial

- ____ Papillary urothelial carcinoma, noninvasive
- ____ Urothelial carcinoma in situ
- ____ Urothelial carcinoma, invasive (conventional)
- ____ Urothelial carcinoma, micropapillary
- ____ Urothelial carcinoma, nested
- Urothelial carcinoma, tubular and microcystic
- Urothelial carcinoma, lymphoepithelioma-like
- Urothelial carcinoma, plasmacytoid
- ____ Urothelial carcinoma, sarcomatoid
- Urothelial carcinoma, giant cell
- ____ Urothelial carcinoma, poorly differentiated
- Urothelial carcinoma, lipid-rich
- ____ Urothelial carcinoma, clear cell (glycogen-rich)
- ____ Urothelial carcinoma with squamous differentiation
- ____ Urothelial carcinoma with glandular differentiation
- ____ Urothelial carcinoma with trophoblastic differentiation
- Urothelial carcinoma with Müllerian differentiation
- Squamous
- Squamous cell carcinoma

COMMENTS

Comment(s): _____

Explanatory Notes

A. History

A relevant history is important for interpretation of all upper urinary tract (renal pelvis and ureter) specimens. A history of renal stones, recent urinary tract procedures, infections, or obstruction can influence the interpretation of random biopsies obtained from patients with hematuria. Any neoplasms previously diagnosed should be specified, including the histologic type, primary site, and histologic grade. Primary tumors may be associated with hereditary nonpolyposis colon cancer (HNPCC) syndrome (Lynch syndrome II). Renal pelvic tumors are more often seen in analgesic abusers, who often have analgesic nephropathy, including papillary necrosis. If prior therapy has been given, it should be described (systemic or intravesical chemotherapy, immunotherapy, radiation, etc.). The method of collection and date also should be specified in urine cytology specimens. Cytologic specimens from the ureter or renal pelvis may be over-interpreted if their site of sampling is not stated.

B. Histologic Type

Like the urinary bladder, the vast majority (more than 95%) of carcinomas of the renal pelvis and ureter are urothelial in origin.^{1,2,3,4,5} The most recent 2022 World Health Organization (WHO) classification of tumors of the urinary tract, including for ureter and renal pelvis, is provided in this note. Benign tumors are included in this classification because, within the same patient, a spectrum of differentiation from benign to malignant tumors may be seen, either at the same time or over the clinical course of the disease. The full spectrum of invasive urothelial carcinoma and its subtypes (variants) as found in the urinary bladder may also be found in the upper tract. In cases of mixed urothelial subtypes and/or divergent differentiations, each component should be reported, including admixed neuroendocrine carcinoma if present. The distinction between a urothelial carcinoma with divergent squamous, glandular, or Müllerian differentiation, and a pure squamous cell carcinoma, adenocarcinoma or Müllerian is important. The 2022 WHO classification, requires a pure histology of squamous cell carcinoma, adenocarcinoma in situ (CIS) urothelial component being considered as urothelial carcinoma with divergent differentiation.

Lynch syndrome, also known as hereditary nonpolyposis colorectal cancer, predisposes patients to urological cancer, particularly upper tract urothelial carcinoma.^{6,7,8} Upper tract urothelial carcinoma develops in up to 28% of patients with known Lynch syndrome. Therefore, pathologists should be aware of Lynch syndrome and their important role in identifying Lynch syndrome patients by considering appropriate tissue tests. Recently several guidelines have been published regarding when and what tissue testing is appropriate for screening patients with upper tract urothelial carcinoma.

2022 WHO Classification of Epithelial Tumors of the Urothelial Tract

Urothelial tumors

Invasive urothelial carcinoma

Conventional urothelial carcinoma Urothelial carcinoma with squamous differentiation Urothelial carcinoma with glandular differentiation Urothelial carcinoma with trophoblastic differentiation Nested urothelial carcinoma Tubular and microcystic urothelial carcinomas Micropapillary urothelial carcinoma Lymphoepithelioma-like urothelial carcinoma Plasmacytoid urothelial carcinoma

Giant cell urothelial carcinoma Lipid-rich urothelial carcinoma Clear cell (glycogen-rich) urothelial carcinoma Urothelial carcinoma, poorly differentiated *Noninvasive urothelial lesions* Urothelial carcinoma in situ Noninvasive papillary urothelial carcinoma, high grade Noninvasive papillary urothelial carcinoma, low grade Papillary urothelial neoplasm of low malignant potential Urothelial papilloma Inverted urothelial papilloma

<u>Squamous cell neoplasms</u> Squamous cell carcinoma Verrucous carcinoma Squamous papilloma

<u>Glandular neoplasms</u> Adenocarcinoma, NOS Enteric Mucinous Mixed Signet-ring cell Adenocarcinoma in situ Villous adenoma

<u>Urachal and diverticular neoplasms</u> Urachal carcinoma Diverticular carcinoma

<u>Tumors of Mullerian type</u> Clear cell adenocarcinoma Endometrioid carcinoma

<u>Neuroendocrine neoplasms</u> Small cell neuroendocrine carcinoma Large cell neuroendocrine carcinoma Mixed neuroendocrine neoplasm Well-differentiated neuroendocrine tumor Paraganglioma

C. Histologic Grade

Flat intraepithelial lesions and papillary and invasive lesions are graded separately. 1.2.3.4.5.6 In the 1973 WHO classification, papillary lesions were classified as papillomas and transitional cell carcinomas, grades 1, 2, and 3. Due to the need for a universally acceptable system, the World Health Organization/International Society of Urological Pathology (WHO/ISUP) consensus classification was proposed in 1998. This system is adopted in the 2004 WHO classification and has been validated by many studies to be prognostically significant. The 2016 WHO and 2022 WHO systems used essentially the same classification with minor modifications. Other systems may still be used according to institutional preference. Tumor grade according to both the 2004 WHO system and the 1973 WHO system may be concurrently used.

The vast majority of invasive urothelial carcinoma are high-grade with uncommon cases of invasive lowgrade tumors reported. Invasive urothelial carcinoma subtypes are graded as high-grade tumors, although these tumors should not be considered as a homogenous group in terms of behavior. Pure squamous carcinomas and adenocarcinomas are graded based on tumor differentiation as well-differentiated, moderately differentiated, and poorly differentiated.

D. Extent of Invasion

Depth of invasion and pathologic stage are the most important prognostic indicators for patients with neoplasms of the upper urinary tract.^{1,2,3} A critical role of the surgical pathologist is to diagnose the depth and extent of invasion into the subepithelial connective tissue/lamina propria (T1), muscularis propria (T2). The patterns of invasion are similar to the urinary bladder, except that for renal pelvis carcinoma, the type of tumor involvement of the kidney, when present, impacts stage. Also, it is important to note that the lamina propria is absent beneath the urothelium lining the renal papillae in the pelvis and is thin along the minor calyces.

As in the urinary bladder, in papillary tumors, invasion occurs most often at the base of the tumor and very infrequently in the stalk. Tumor infiltrating the lamina propria is T1, and like the urinary bladder, there is no accepted approach for assessing depth of lamina propria invasion. Designation of a tumor if muscularis propria muscle-invasive or not is important. Upper tract papillary urothelial carcinoma may also have inverted non-invasive growth pushing into subepithelial structures (Ta) that must be distinguished from true invasion of subepithelial structures. For renal pelvic tumors, in-situ extension of carcinoma into renal collecting ducts and renal tubules does not affect stage, while carcinoma invading into the renal parenchyma is T3.
