

COLLEGE of AMERICAN
PATHOLOGISTS

New histology, same rules?

Approach to validation of slide-free multiphoton
histology for clinical use

Richard Torres, MD, MS
DCPC Webinar Series

April 6, 2022

Richard Torres, MD, MS, FACP

- **Adjunct Associate Professor of Laboratory Medicine, Yale School of Medicine**
- **Co-Founder, Co-CEO, Applikate Technologies, Inc.**
- **Practicing hematopathologist**
- **Research areas: flow cytometry, medical laboratory instrumentation, multiphoton microscopy**

Disclaimer

- **The CAP does not permit reproduction of any substantial portion of the material in this Webinar without its written authorization. The CAP hereby authorizes attendees of the CAP Webinar to use the PDF presentation solely for educational purposes within their own institutions. The CAP prohibits use of the material in the Webinar – and any unauthorized use of the CAP’s name or logo – in connection with promotional efforts by marketers of laboratory equipment, reagents, materials, or services.**
- **Opinions expressed by the speaker are the speaker’s own and do not necessarily reflect an endorsement by the CAP of any organizations, equipment, reagents, materials, or services used by participating laboratories.**

Disclaimer

- **The Clearing Histology with MultiPhoton platform that will be discussed has not been evaluated by the FDA and is not yet approved for primary diagnosis in the US. The performance characteristics described are for the purpose of engendering dialogue and education, and not meant as an endorsement of clinical use.**

Disclosure

- **Current management role and ownership interest in Applikate Technologies, Inc., a company commercializing the Clearing Histology with MultiPhoton (CHiMP) platform**

Sections

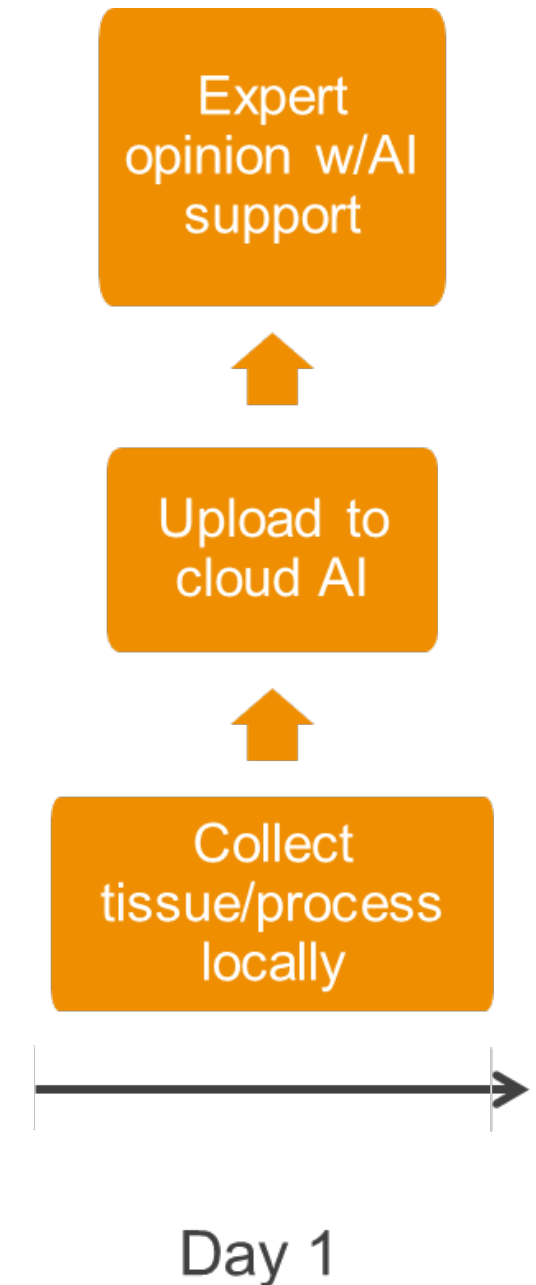

- **Motivation for multiphoton microscopy**
- Physical slides, WSI, and multiphoton comparative risks
- Validation considerations from pathologist point of view
- Validation examples
- Conclusions

Quoted use cases for ex vivo microscopy (EVM)

- Preliminary intraoperative evaluation (e.g. margins)
- Adequacy of core biopsies
- Adequacy of transplant tissue
- Identification of tissue for ancillary studies
- Identification of tissue for biorepositories

The true potential of EVM

- **A replacement for physical slides / whole slide imaging**
 - Faster turnaround time
 - Direct path to digital – consultation and digital analysis
 - Reduced labor (cost) requirements
 - More levels, more data, 3D patterns
 - Preserved tissue for ancillary studies

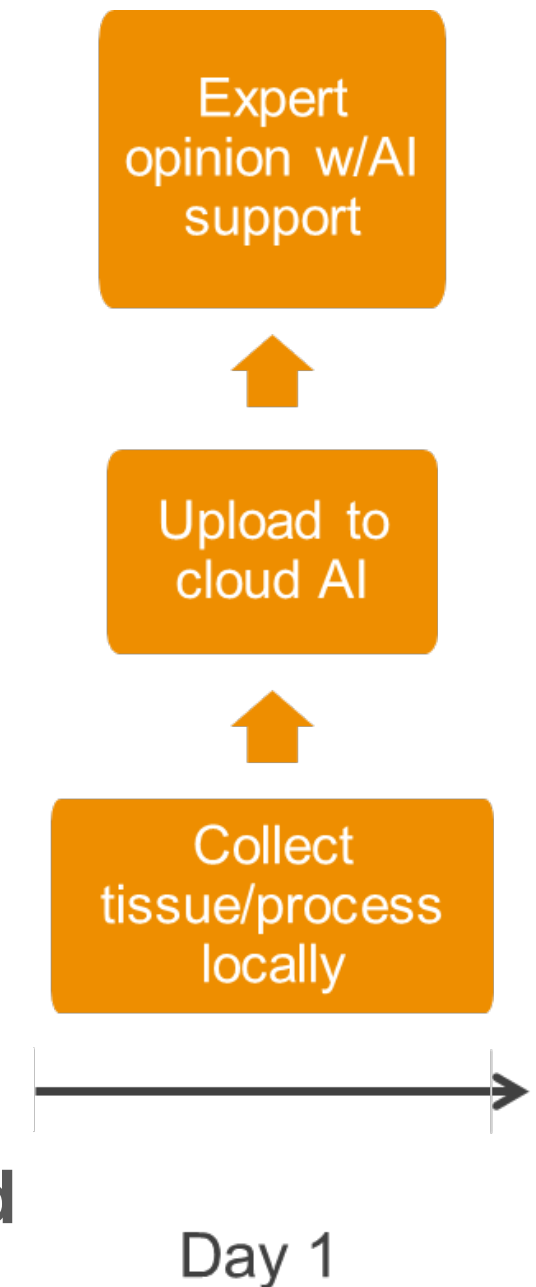

The true potential of EVM

- A replacement for physical slides / whole slide imaging
 - Faster turnaround time
 - Direct path to digital – consultation and digital analysis
 - Reduced labor (cost) requirements
 - More levels, more data, 3D patterns
 - Preserved tissue for ancillary studies

What is holding us back?

Inferior image quality would mean physical slides still required

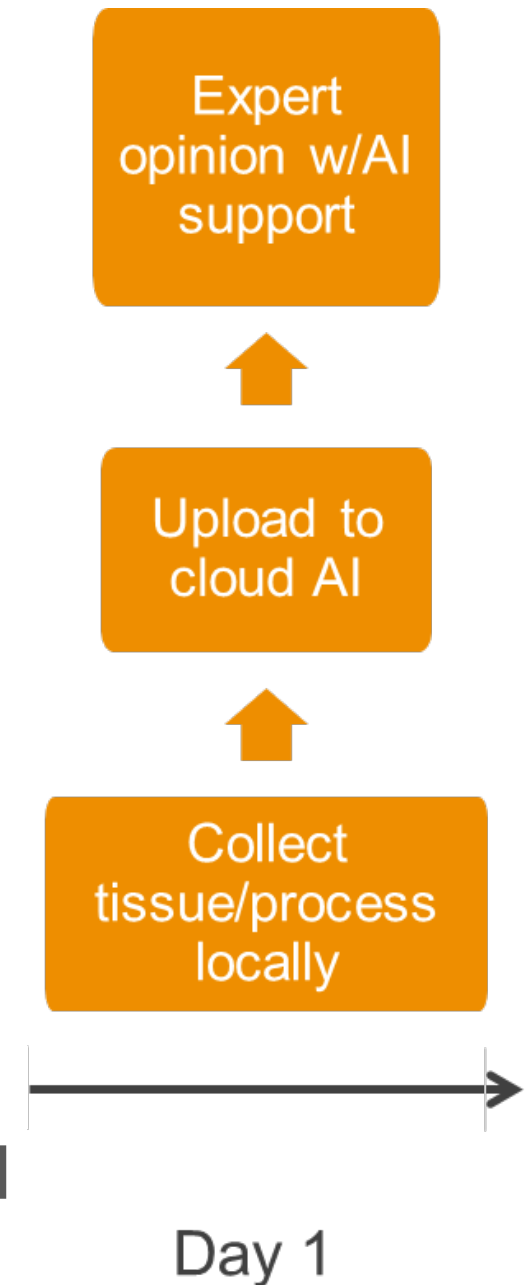

The true potential of EVM

- A replacement for physical slides / whole slide imaging
 - Faster turnaround time
 - Direct path to digital – consultation and digital analysis
 - Reduced labor (cost) requirements
 - More levels, more data, 3D patterns
 - Preserved tissue for ancillary studies

What is holding us back?

Inferior image quality would mean physical slides still required
+ cost + effort + labor

The whole slide imaging (WSI) parallel

- Ease of remote review and consultation could improve diagnostic accuracy/precision
- Digital analysis tools could improve diagnostic accuracy/precision

What is holding us back?

Inferior image quality would mean physical slides still required

The whole slide imaging (WSI) parallel

- Ease of remote review and consultation could improve diagnostic accuracy/precision
- Digital analysis tools could improve diagnostic accuracy/precision

What is holding us back?

Inferior image quality would mean physical slides still required
+ cost + effort + labor

Multiphoton has high image quality potential

- Focusing a pulsed infrared laser generates sufficient energy to excite fluorescence in only a tiny volume
 - Features:
 - High resolution potential in thick tissue
 - Some depth
 - Low tissue damage risk
 - Perceived limitations
 - Inferior images to physical slides/WSI
 - Expensive
 - Complicated to set up and use
 - Additional personnel

Steve Ruzin, UCBerkeley

Centonze et al, Biophys J, 1998

140 μm

CHiMP is a multiphoton approach for histology

CHiMP = Clearing Histology with MultiPhoton Microscopy

Collect tissue

Place in holder

Process to clearing

Place in imager

View remotely

Clearing improves quality and depth imaging

- Refractive index differences distort and dim
- Refractive index: water = 1.33, proteins and membranes ≈ 1.55 , xylene ≈ 1.49
- Benzyl Alcohol/Benzyl Benzoate BABB ≈ 1.55

Fluorescent dyes recreate H&E

Nuclear

Protein

***Color
convolution***

Torres et al, *Arch Path Lab Med*: June 2013

Intact full cores can be imaged using CHiMP

Human prostate biopsy imaged through full thickness with CHiMP. Slice spacing 100 μ m, scale bar 1mm.

Sections

- Motivation for multiphoton microscopy
- **Physical slides, WSI, and multiphoton comparative risks**
- Validation considerations from pathologist point of view
- Validation examples
- Conclusions

Histology has many intrinsic quality risks

- List from the CAP 'H&E Troubleshooting Guide'

1. Nuclei not crisp, “smudgy” nuclei, nuclear bubbling.
2. Three distinct shades of eosin not seen
3. Poor contrast between nuclear and cytoplasmic stain
4. Cytoplasmic stain is too dark
5. Cytoplasmic stain is too light
6. Nuclear stain too dark
7. Nuclear stain too light
8. Uneven hematoxylin or eosin staining
9. Red brown nuclei
10. Dark precipitate scattered throughout
11. Hazy appearance or eosin bleeding throughout
12. Air under the coverslip or mounting media on top
13. Brown granular deposit

H&E Troubleshooting Table	
Problem	Check the following:
1. Nuclei not crisp, "smudgy" nuclei, nuclear bubbling or no defined chromatin pattern seen. There is no contrast in the nuclear chromatin staining against cytoplasm and there is no contrast in nuclear staining against nucleoli	1. Hematoxylin concentration: Is the concentration too high or too low? 2. Hematoxylin age: Is the hematoxylin too old? 3. Hematoxylin pH: Is the pH too high or too low? 4. Hematoxylin application: Is the hematoxylin applied evenly? 5. Hematoxylin rinsing: Is the hematoxylin rinsed properly? 6. Hematoxylin clearing: Is the hematoxylin cleared properly? 7. Hematoxylin counterstain: Is the counterstain applied properly? 8. Hematoxylin mounting: Is the mounting media applied properly?
2. Three distinct shades of eosin not seen	1. Eosin concentration: Is the concentration too high or too low? 2. Eosin age: Is the eosin too old? 3. Eosin pH: Is the pH too high or too low? 4. Eosin application: Is the eosin applied evenly? 5. Eosin rinsing: Is the eosin rinsed properly? 6. Eosin clearing: Is the eosin cleared properly? 7. Eosin counterstain: Is the counterstain applied properly? 8. Eosin mounting: Is the mounting media applied properly?
3. Poor contrast between nuclear and cytoplasmic stain	1. Hematoxylin concentration: Is the concentration too high or too low? 2. Eosin concentration: Is the concentration too high or too low? 3. Hematoxylin age: Is the hematoxylin too old? 4. Eosin age: Is the eosin too old? 5. Hematoxylin pH: Is the pH too high or too low? 6. Eosin pH: Is the pH too high or too low? 7. Hematoxylin application: Is the hematoxylin applied evenly? 8. Eosin application: Is the eosin applied evenly? 9. Hematoxylin rinsing: Is the hematoxylin rinsed properly? 10. Eosin rinsing: Is the eosin rinsed properly? 11. Hematoxylin clearing: Is the hematoxylin cleared properly? 12. Eosin clearing: Is the eosin cleared properly? 13. Hematoxylin counterstain: Is the counterstain applied properly? 14. Eosin counterstain: Is the counterstain applied properly? 15. Hematoxylin mounting: Is the mounting media applied properly? 16. Eosin mounting: Is the mounting media applied properly?
4. Cytoplasmic stain is too dark	1. Eosin concentration: Is the concentration too high or too low? 2. Eosin age: Is the eosin too old? 3. Eosin pH: Is the pH too high or too low? 4. Eosin application: Is the eosin applied evenly? 5. Eosin rinsing: Is the eosin rinsed properly? 6. Eosin clearing: Is the eosin cleared properly? 7. Eosin counterstain: Is the counterstain applied properly? 8. Eosin mounting: Is the mounting media applied properly?
5. Cytoplasmic stain is too light	1. Eosin concentration: Is the concentration too high or too low? 2. Eosin age: Is the eosin too old? 3. Eosin pH: Is the pH too high or too low? 4. Eosin application: Is the eosin applied evenly? 5. Eosin rinsing: Is the eosin rinsed properly? 6. Eosin clearing: Is the eosin cleared properly? 7. Eosin counterstain: Is the counterstain applied properly? 8. Eosin mounting: Is the mounting media applied properly?
6. Nuclear stain too dark	1. Hematoxylin concentration: Is the concentration too high or too low? 2. Hematoxylin age: Is the hematoxylin too old? 3. Hematoxylin pH: Is the pH too high or too low? 4. Hematoxylin application: Is the hematoxylin applied evenly? 5. Hematoxylin rinsing: Is the hematoxylin rinsed properly? 6. Hematoxylin clearing: Is the hematoxylin cleared properly? 7. Hematoxylin counterstain: Is the counterstain applied properly? 8. Hematoxylin mounting: Is the mounting media applied properly?
7. Nuclear stain too light	1. Hematoxylin concentration: Is the concentration too high or too low? 2. Hematoxylin age: Is the hematoxylin too old? 3. Hematoxylin pH: Is the pH too high or too low? 4. Hematoxylin application: Is the hematoxylin applied evenly? 5. Hematoxylin rinsing: Is the hematoxylin rinsed properly? 6. Hematoxylin clearing: Is the hematoxylin cleared properly? 7. Hematoxylin counterstain: Is the counterstain applied properly? 8. Hematoxylin mounting: Is the mounting media applied properly?
8. Uneven hematoxylin or eosin staining	1. Hematoxylin concentration: Is the concentration too high or too low? 2. Eosin concentration: Is the concentration too high or too low? 3. Hematoxylin age: Is the hematoxylin too old? 4. Eosin age: Is the eosin too old? 5. Hematoxylin pH: Is the pH too high or too low? 6. Eosin pH: Is the pH too high or too low? 7. Hematoxylin application: Is the hematoxylin applied evenly? 8. Eosin application: Is the eosin applied evenly? 9. Hematoxylin rinsing: Is the hematoxylin rinsed properly? 10. Eosin rinsing: Is the eosin rinsed properly? 11. Hematoxylin clearing: Is the hematoxylin cleared properly? 12. Eosin clearing: Is the eosin cleared properly? 13. Hematoxylin counterstain: Is the counterstain applied properly? 14. Eosin counterstain: Is the counterstain applied properly? 15. Hematoxylin mounting: Is the mounting media applied properly? 16. Eosin mounting: Is the mounting media applied properly?
9. Red brown nuclei	1. Hematoxylin concentration: Is the concentration too high or too low? 2. Hematoxylin age: Is the hematoxylin too old? 3. Hematoxylin pH: Is the pH too high or too low? 4. Hematoxylin application: Is the hematoxylin applied evenly? 5. Hematoxylin rinsing: Is the hematoxylin rinsed properly? 6. Hematoxylin clearing: Is the hematoxylin cleared properly? 7. Hematoxylin counterstain: Is the counterstain applied properly? 8. Hematoxylin mounting: Is the mounting media applied properly?
10. Dark precipitate scattered throughout	1. Hematoxylin concentration: Is the concentration too high or too low? 2. Hematoxylin age: Is the hematoxylin too old? 3. Hematoxylin pH: Is the pH too high or too low? 4. Hematoxylin application: Is the hematoxylin applied evenly? 5. Hematoxylin rinsing: Is the hematoxylin rinsed properly? 6. Hematoxylin clearing: Is the hematoxylin cleared properly? 7. Hematoxylin counterstain: Is the counterstain applied properly? 8. Hematoxylin mounting: Is the mounting media applied properly?
11. Hazy appearance or eosin bleeding throughout	1. Eosin concentration: Is the concentration too high or too low? 2. Eosin age: Is the eosin too old? 3. Eosin pH: Is the pH too high or too low? 4. Eosin application: Is the eosin applied evenly? 5. Eosin rinsing: Is the eosin rinsed properly? 6. Eosin clearing: Is the eosin cleared properly? 7. Eosin counterstain: Is the counterstain applied properly? 8. Eosin mounting: Is the mounting media applied properly?
12. Air under the coverslip or mounting media on top	1. Mounting media: Is the mounting media applied properly? 2. Coverslip: Is the coverslip applied properly? 3. Mounting media: Is the mounting media applied properly? 4. Coverslip: Is the coverslip applied properly?
13. Brown granular deposit	1. Mounting media: Is the mounting media applied properly? 2. Coverslip: Is the coverslip applied properly? 3. Mounting media: Is the mounting media applied properly? 4. Coverslip: Is the coverslip applied properly?

H&E Troubleshooting Table	
Problem	Check the following:
1. Nuclei not crisp, "smudgy" nuclei, nuclear bubbling or no defined chromatin pattern seen. There is no contrast in the nuclear chromatin staining against cytoplasm and there is no contrast in nuclear staining against nucleoli	1. Hematoxylin concentration: Is the concentration too high or too low? 2. Hematoxylin age: Is the hematoxylin too old? 3. Hematoxylin pH: Is the pH too high or too low? 4. Hematoxylin application: Is the hematoxylin applied evenly? 5. Hematoxylin rinsing: Is the hematoxylin rinsed properly? 6. Hematoxylin clearing: Is the hematoxylin cleared properly? 7. Hematoxylin counterstain: Is the counterstain applied properly? 8. Hematoxylin mounting: Is the mounting media applied properly?
2. Three distinct shades of eosin not seen	1. Eosin concentration: Is the concentration too high or too low? 2. Eosin age: Is the eosin too old? 3. Eosin pH: Is the pH too high or too low? 4. Eosin application: Is the eosin applied evenly? 5. Eosin rinsing: Is the eosin rinsed properly? 6. Eosin clearing: Is the eosin cleared properly? 7. Eosin counterstain: Is the counterstain applied properly? 8. Eosin mounting: Is the mounting media applied properly?
3. Poor contrast between nuclear and cytoplasmic stain	1. Hematoxylin concentration: Is the concentration too high or too low? 2. Eosin concentration: Is the concentration too high or too low? 3. Hematoxylin age: Is the hematoxylin too old? 4. Eosin age: Is the eosin too old? 5. Hematoxylin pH: Is the pH too high or too low? 6. Eosin pH: Is the pH too high or too low? 7. Hematoxylin application: Is the hematoxylin applied evenly? 8. Eosin application: Is the eosin applied evenly? 9. Hematoxylin rinsing: Is the hematoxylin rinsed properly? 10. Eosin rinsing: Is the eosin rinsed properly? 11. Hematoxylin clearing: Is the hematoxylin cleared properly? 12. Eosin clearing: Is the eosin cleared properly? 13. Hematoxylin counterstain: Is the counterstain applied properly? 14. Eosin counterstain: Is the counterstain applied properly? 15. Hematoxylin mounting: Is the mounting media applied properly? 16. Eosin mounting: Is the mounting media applied properly?
4. Cytoplasmic stain is too dark	1. Eosin concentration: Is the concentration too high or too low? 2. Eosin age: Is the eosin too old? 3. Eosin pH: Is the pH too high or too low? 4. Eosin application: Is the eosin applied evenly? 5. Eosin rinsing: Is the eosin rinsed properly? 6. Eosin clearing: Is the eosin cleared properly? 7. Eosin counterstain: Is the counterstain applied properly? 8. Eosin mounting: Is the mounting media applied properly?
5. Cytoplasmic stain is too light	1. Eosin concentration: Is the concentration too high or too low? 2. Eosin age: Is the eosin too old? 3. Eosin pH: Is the pH too high or too low? 4. Eosin application: Is the eosin applied evenly? 5. Eosin rinsing: Is the eosin rinsed properly? 6. Eosin clearing: Is the eosin cleared properly? 7. Eosin counterstain: Is the counterstain applied properly? 8. Eosin mounting: Is the mounting media applied properly?
6. Nuclear stain too dark	1. Hematoxylin concentration: Is the concentration too high or too low? 2. Hematoxylin age: Is the hematoxylin too old? 3. Hematoxylin pH: Is the pH too high or too low? 4. Hematoxylin application: Is the hematoxylin applied evenly? 5. Hematoxylin rinsing: Is the hematoxylin rinsed properly? 6. Hematoxylin clearing: Is the hematoxylin cleared properly? 7. Hematoxylin counterstain: Is the counterstain applied properly? 8. Hematoxylin mounting: Is the mounting media applied properly?
7. Nuclear stain too light	1. Hematoxylin concentration: Is the concentration too high or too low? 2. Hematoxylin age: Is the hematoxylin too old? 3. Hematoxylin pH: Is the pH too high or too low? 4. Hematoxylin application: Is the hematoxylin applied evenly? 5. Hematoxylin rinsing: Is the hematoxylin rinsed properly? 6. Hematoxylin clearing: Is the hematoxylin cleared properly? 7. Hematoxylin counterstain: Is the counterstain applied properly? 8. Hematoxylin mounting: Is the mounting media applied properly?
8. Uneven hematoxylin or eosin staining	1. Hematoxylin concentration: Is the concentration too high or too low? 2. Eosin concentration: Is the concentration too high or too low? 3. Hematoxylin age: Is the hematoxylin too old? 4. Eosin age: Is the eosin too old? 5. Hematoxylin pH: Is the pH too high or too low? 6. Eosin pH: Is the pH too high or too low? 7. Hematoxylin application: Is the hematoxylin applied evenly? 8. Eosin application: Is the eosin applied evenly? 9. Hematoxylin rinsing: Is the hematoxylin rinsed properly? 10. Eosin rinsing: Is the eosin rinsed properly? 11. Hematoxylin clearing: Is the hematoxylin cleared properly? 12. Eosin clearing: Is the eosin cleared properly? 13. Hematoxylin counterstain: Is the counterstain applied properly? 14. Eosin counterstain: Is the counterstain applied properly? 15. Hematoxylin mounting: Is the mounting media applied properly? 16. Eosin mounting: Is the mounting media applied properly?
9. Red brown nuclei	1. Hematoxylin concentration: Is the concentration too high or too low? 2. Hematoxylin age: Is the hematoxylin too old? 3. Hematoxylin pH: Is the pH too high or too low? 4. Hematoxylin application: Is the hematoxylin applied evenly? 5. Hematoxylin rinsing: Is the hematoxylin rinsed properly? 6. Hematoxylin clearing: Is the hematoxylin cleared properly? 7. Hematoxylin counterstain: Is the counterstain applied properly? 8. Hematoxylin mounting: Is the mounting media applied properly?
10. Dark precipitate scattered throughout	1. Hematoxylin concentration: Is the concentration too high or too low? 2. Hematoxylin age: Is the hematoxylin too old? 3. Hematoxylin pH: Is the pH too high or too low? 4. Hematoxylin application: Is the hematoxylin applied evenly? 5. Hematoxylin rinsing: Is the hematoxylin rinsed properly? 6. Hematoxylin clearing: Is the hematoxylin cleared properly? 7. Hematoxylin counterstain: Is the counterstain applied properly? 8. Hematoxylin mounting: Is the mounting media applied properly?
11. Hazy appearance or eosin bleeding throughout	1. Eosin concentration: Is the concentration too high or too low? 2. Eosin age: Is the eosin too old? 3. Eosin pH: Is the pH too high or too low? 4. Eosin application: Is the eosin applied evenly? 5. Eosin rinsing: Is the eosin rinsed properly? 6. Eosin clearing: Is the eosin cleared properly? 7. Eosin counterstain: Is the counterstain applied properly? 8. Eosin mounting: Is the mounting media applied properly?
12. Air under the coverslip or mounting media on top	1. Mounting media: Is the mounting media applied properly? 2. Coverslip: Is the coverslip applied properly? 3. Mounting media: Is the mounting media applied properly? 4. Coverslip: Is the coverslip applied properly?
13. Brown granular deposit	1. Mounting media: Is the mounting media applied properly? 2. Coverslip: Is the coverslip applied properly? 3. Mounting media: Is the mounting media applied properly? 4. Coverslip: Is the coverslip applied properly?

Igho OE, Aimakhume A. Artifacts in histology: A 1-year retrospective study. *Ann Bioanthropol* 2017;5:34-9.

WSI compounds intrinsic histology artifacts

**Hue/intensity variability
dyes + imager + monitor**

**Loss of
Focus**

Multiphoton avoids many standard artifacts

e.g. breast tissue that could be very difficult to cut

Multiphoton could introduce new artifacts

e.g. oxalate crystals

Physical slide

**50 um
depth**

**200 um
depth**

Multiphoton

Sections

CAP EVM validation principles

Ex Vivo Microscopy checklist items

ANP.23560 EVM - System Validation

Phase I

The laboratory performs validation studies before the Ex Vivo Microscopy (EVM) technology is used for the intended purpose(s).

NOTE: The specific components of the validation study are left to the discretion of the laboratory. However, studies should be performed using an adequate number of cases, data should be evaluated, and a summary statement provided prior to implementation. Records of how discordant data or unacceptable variations from the expected were resolved are required.

As general guiding principles, the validation process should:

- *Closely emulate the real-world environment and involve tissue types and clinical settings relevant to the intended use(s)*
- *Be carried out by or under the supervision of a pathologist adequately trained to use the EVM system*
- *Encompass the entire EVM system, with reevaluation if a significant change is made to a previously validated system.*

CAP EVM validation principles

ANP.23570 EVM - Function Checks

Phase II

Regular function checks are performed and records maintained on the Ex Vivo Microscopy (EVM) system/instrument.

NOTE: Function checks include confirmation that an instrument or item of equipment operates according to manufacturer's specifications before routine use, at prescribed intervals, or after minor adjustment. Depending on the type of system, function checks may include calibration.

ANP.23580 EVM - Method Performance Specifications Availability

Phase II

The current Ex Vivo Microscopy (EVM) methods and all significant changes to analytical methodology, including performance specifications and supporting validation data, are maintained by the laboratory.

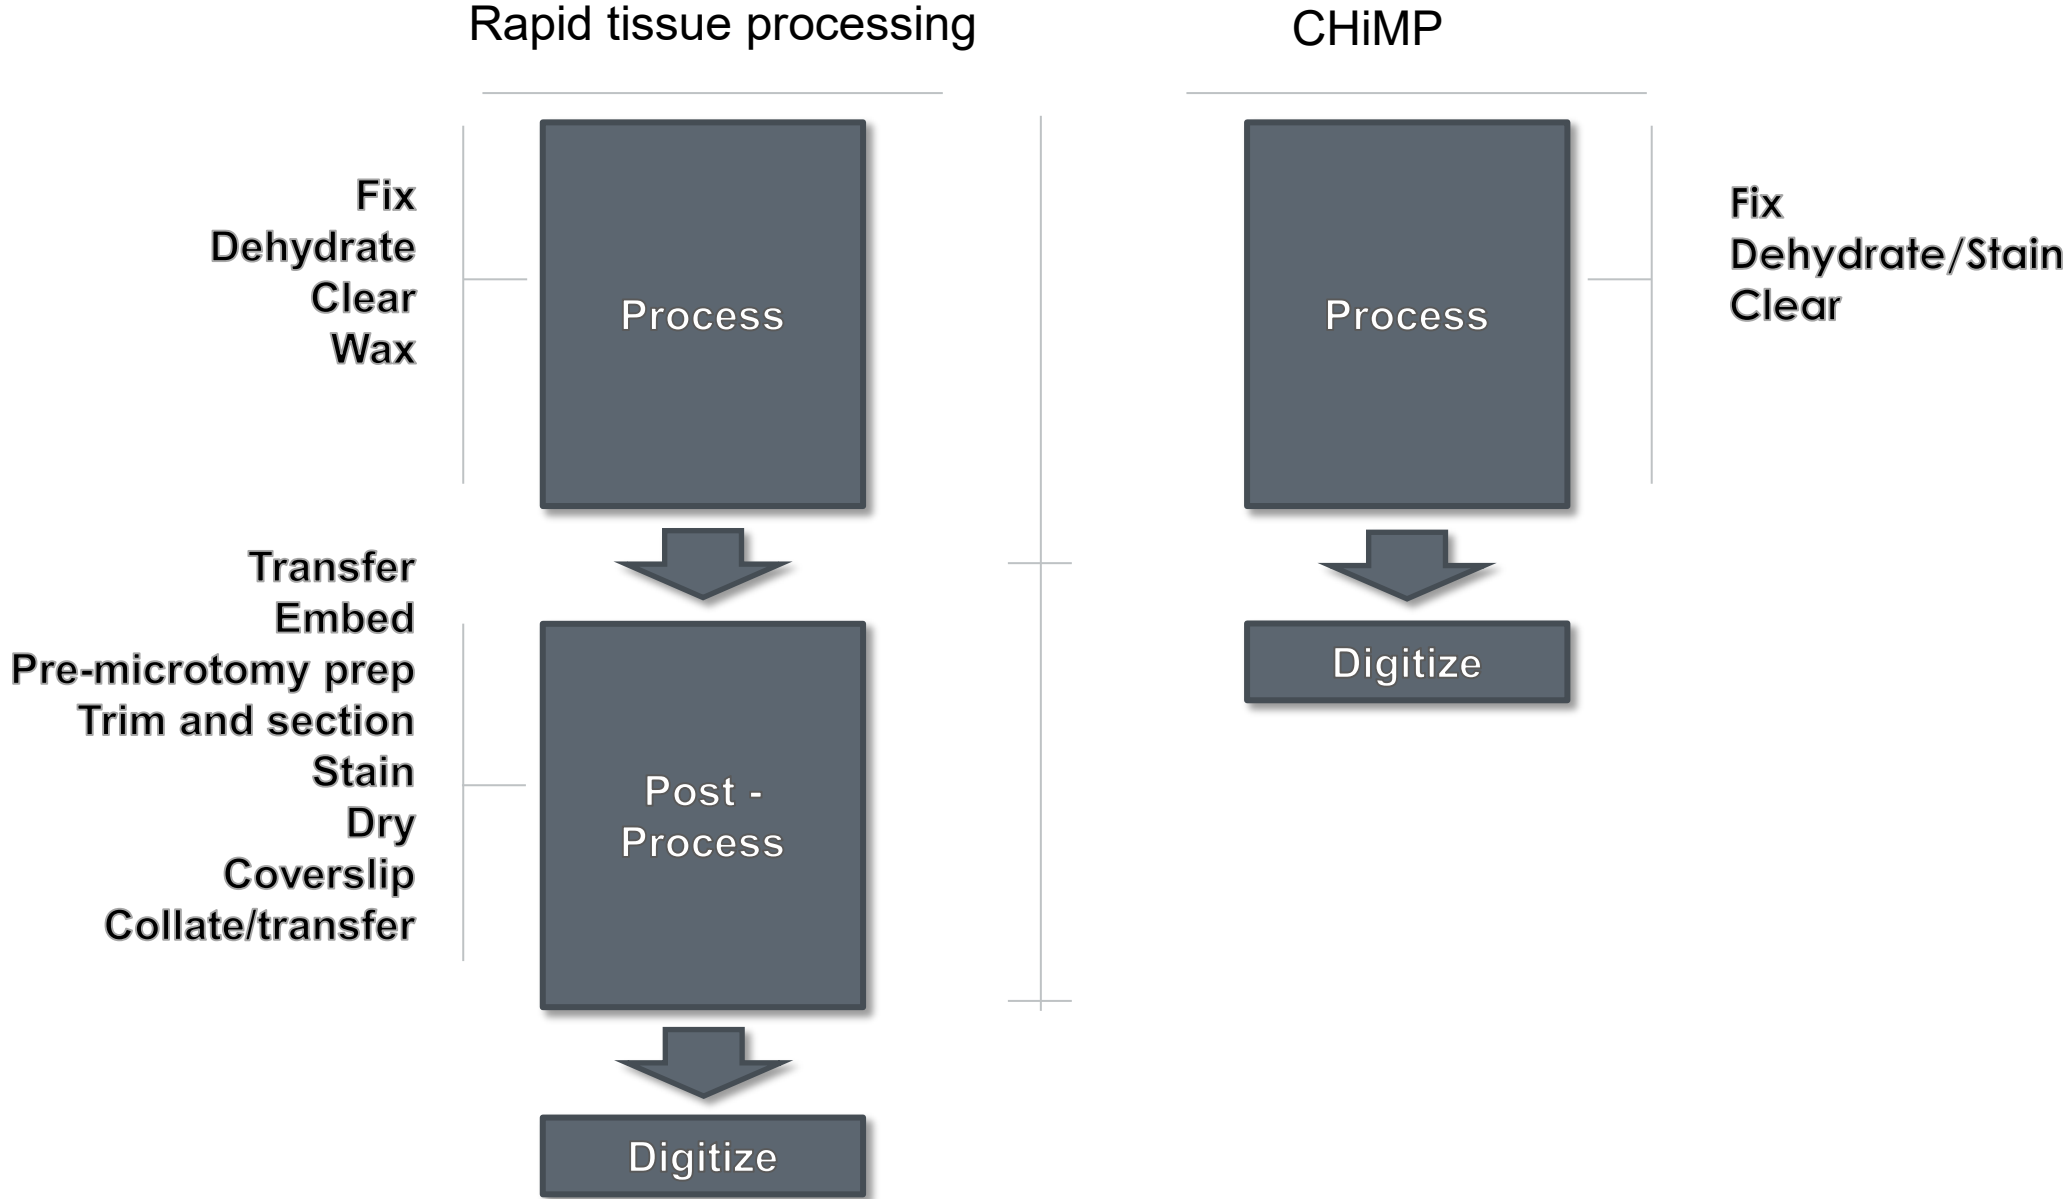

ANP.12500 Record Retention

Phase II

Surgical pathology records and materials are retained for an appropriate period.

Digital images used for primary diagnosis	10 years if original glass slides are not available
Datasets from In-Vivo Microscopy (IVM) or Ex Vivo Microscopy (EVM) systems used to aid in interpretation or diagnosis	10 years - data must be retrievable for this period (Subject to Note 6 below)

CHiMP preparation is a variation of standard

Even light microscopes can accentuate variability

How do we know that it is good enough?

CAP validation principles

AP checklist items

ANP.11734 Slide Quality

Phase II

Slides are of sufficient quality for diagnosis.

NOTE: Histopathology slides must be of adequate technical quality to be diagnostically useful. Criteria to evaluate include adequate tissue fixation, processing, thickness of sections, absence of interfering tissue folds and tears, and good staining technique and cover slipping. For hematoxylin and eosin and other routine stains, the patient slide serves as the internal control to ensure adequate staining technique. The sections must be cut from sufficient depth in the block to include the entire tissue plane.

CAP validation principles

AP checklist items

ANP.23120 Tissue Processing Programs

Phase II

Tissue processing programs are validated.

NOTE: To validate new processing programs, laboratories should run tissue samples of the same size, thickness and fixation in duplicate. Reagents on the processor(s) should be comparable, e.g. all fresh reagents. Process, embed, cut, and stain slides at the same time and evaluate the quality of the blocks, e.g. firmness, ease of cutting. The slides should be evaluated by the pathologist without knowledge of which processing program was used and graded on quality of section and staining. The new processing program must be of adequate quality before being put into use.

This method may also be used to verify a routine processing program before putting a new processor into clinical service.

WSI CAP / API / ASCP validation principles

Validating Whole Slide Imaging Systems for Diagnostic Purposes in Pathology: 2021 Guideline Update

Summary of recommendations

At least 60 samples per use case (e.g. H&E of fixed tissue, frozen, hematology)

Reflect spectrum and complexity of routine work

Another 20 cases for additional applications

Establish concordance between digital and glass for same observer

If <95% concordance, investigate

At least 2 week washout between reviews

2. Evans AJ, Brown RW, Bui MM, Chlipala EA, Lacchetti C, Milner Jr DA, Pantanowitz L, Parwani AV, Reid K, Riben MW, Reuter VE. Validating whole slide imaging systems for diagnostic purposes in pathology: guideline update from the College of American Pathologists in collaboration with the American Society for Clinical Pathology and the Association for Pathology Informatics. *Archives of Pathology & Laboratory Medicine*. 2022 Apr;146(4):440-50.

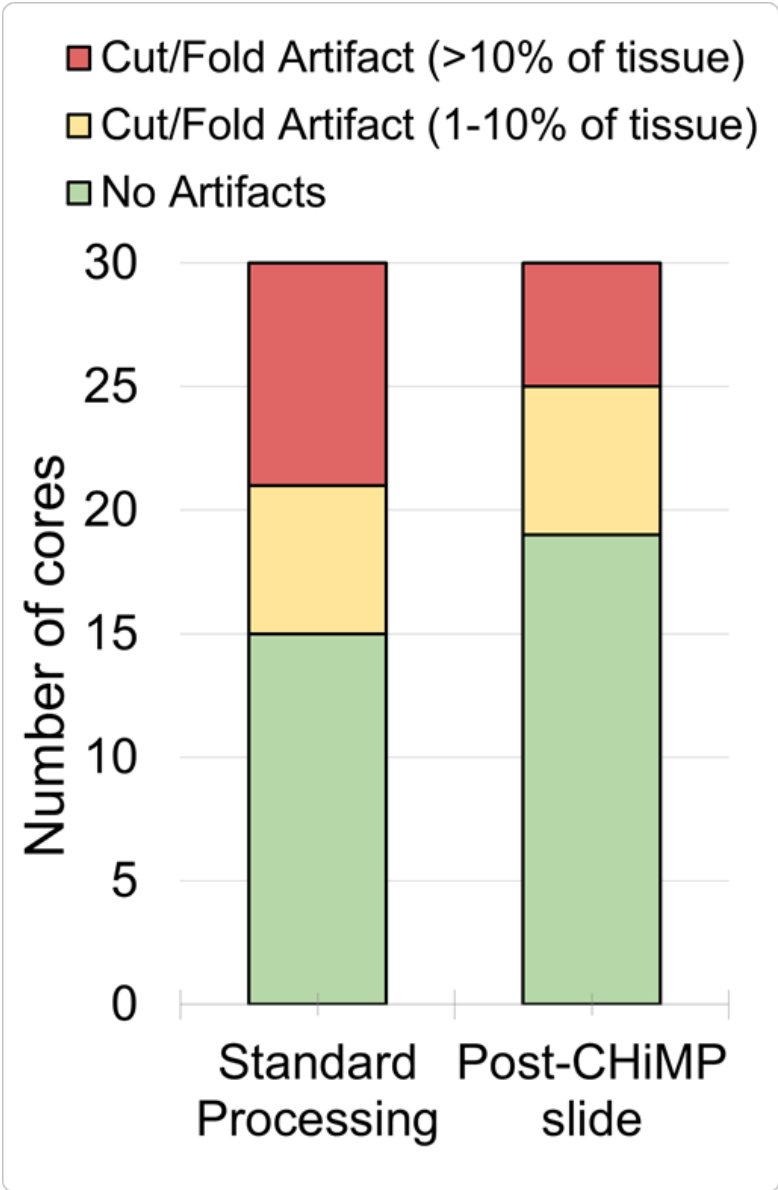

Drug analogue conceptual framework for EVM primary diagnosis

Phase	Specimen source
'Phase 1': 'Safety' – Are gold-standard diagnostic processes adversely affected?	Paired animal specimens Paired/unpaired excess human samples
'Phase 2': 'Efficacy' – Are diagnostic features identifiable at least as well as in physical slides?	Paired/unpaired excess human samples Fresh excess human samples
'Phase 3': 'Implementation trial' – How well does it work in routine clinical practice compared to standard?	Clinical specimens used in diagnosis

Sections

- Motivation for multiphoton microscopy
- Physical slides, WSI, and multiphoton comparative risks
- Validation considerations from pathologist point of view
- **Validation examples**
- Conclusions

Phase 1 examples

Standard processing

Post-CHiMP

Phase 1 examples

Antibody testing post-CHiMP processing and imaging, internally controlled
Excess human samples

PIN-4 Normal

PIN-4 Tumor

AE1/AE3

CD45

TTF-1

ER

Phase 2 examples

Excess human tissue sample multiphoton images

Breast Ca

Lung Ca

Liver Ca

Renal Ca

Phase 2 examples

Excess human samples

Fine features

Phase 2/3 examples

Paired fresh clinical samples for research (not used in clinical care)

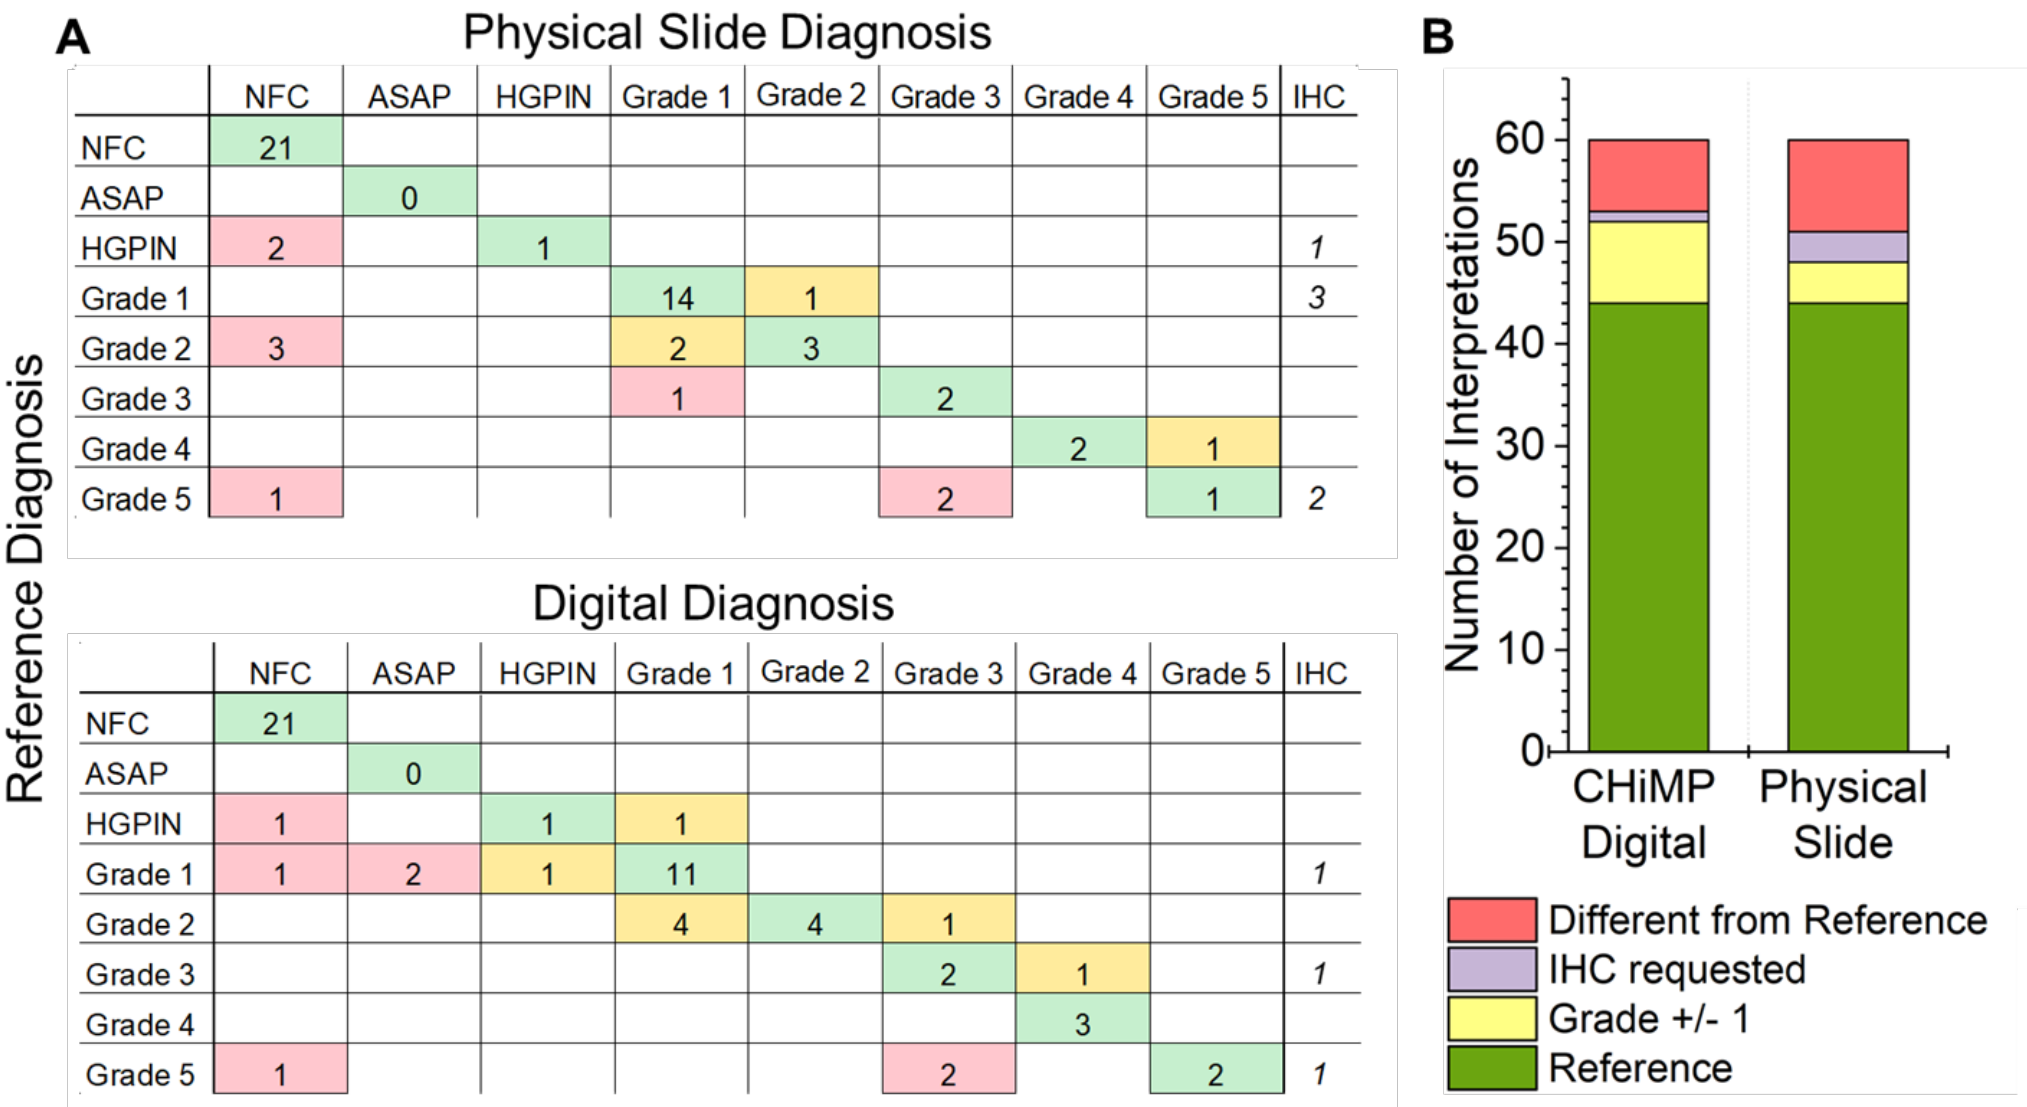

Physical slide

CHiMP multiphoton

Phase 2/3 example

Paired fresh clinical samples for research (not used in clinical care)

Torres et al, Arch Path Lab Med: 1 May 2021

Phase 3 example

Paired fresh clinical samples used in clinical care

Specimen source:

- Kidney needle core biopsies (n > 60)
- Medical or Transplant

Specimen prep:

- Standard formalin biopsy bottle to path lab
- Prepped/imaged/returned in < 4 hrs

Post-imaging:

- Standard processing + stains

Diagnostic comparison:

- Standard core and post-CHiMP core used for clinical diagnosis
- Diagnosis on CHiMP images post-washout

Sections

- Motivation for multiphoton microscopy
- Physical slides, WSI, and multiphoton comparative risks
- Validation considerations from pathologist point of view
- Validation examples
- **Conclusions**

Conclusions

- **Current histology standard has known limitations, including quality**
- **There are existing frameworks for assessing new ex vivo microscopy technology validations**
- **Whole slide imaging is a relevant case study for EVM validation**
- **Safety, efficacy, and implementation is a potentially applicable stepwise validation concept**
- **Overall diagnostic quality is the essence of new EVM technology validation from pathologist perspective**
- **Pathologist assessment can determine overall diagnostic quality**

THANK YOU!

Thank you for attending our webinar “**New histology, same rules? Approach to validation of slide-free multiphoton histology for clinical use**” by Richard Torres, MD, MS. For comments about this webinar or suggestions for upcoming webinars, contact Al@cap.org

NOTE: There is no CME/CE credit available for today’s complimentary webinar. The recording of the presentation will be sent out in about 1 week.
