

Protocol for the Examination of Specimens From Patients With Uveal Melanoma

Version: 4.1.0.0

Protocol Posting Date: June 2021

CAP Laboratory Accreditation Program Protocol Required Use Date: March 2022

The changes included in this current protocol version affect accreditation requirements. The new deadline for implementing this protocol version is reflected in the above accreditation date.

For accreditation purposes, this protocol should be used for the following procedures AND tumor types:

Procedure	Description
Resection	Includes local resection, enucleation, and partial or complete exenteration
Tumor Type	Description
Uveal melanoma	Limited to melanoma of the iris, ciliary body, and choroid

The following tumor types should NOT be reported using this protocol:

Tumor Type
Cutaneous melanoma (consider Skin Melanoma protocol)

Authors

Tatyana Milman, MD*; Patricia Chevez-Barrios, MD*; Ralph C. Eagle, Jr., MD*; Hans E. Grossniklaus, MD, MBA*; Dan S. Gombos, MD, FACS*.

With guidance from the CAP Cancer and CAP Pathology Electronic Reporting Committees.

* Denotes primary author.

Accreditation Requirements

This protocol can be utilized for a variety of procedures and tumor types for clinical care purposes. For accreditation purposes, only the definitive primary cancer resection specimen is required to have the core and conditional data elements reported in a synoptic format.

- Core data elements are required in reports to adequately describe appropriate malignancies. For accreditation purposes, essential data elements must be reported in all instances, even if the response is “not applicable” or “cannot be determined.”
- Conditional data elements are only required to be reported if applicable as delineated in the protocol. For instance, the total number of lymph nodes examined must be reported, but only if nodes are present in the specimen.
- Optional data elements are identified with “+” and although not required for CAP accreditation purposes, may be considered for reporting as determined by local practice standards.

The use of this protocol is not required for recurrent tumors or for metastatic tumors that are resected at a different time than the primary tumor. Use of this protocol is also not required for pathology reviews performed at a second institution (ie, secondary consultation, second opinion, or review of outside case at second institution).

Synoptic Reporting

All core and conditionally required data elements outlined on the surgical case summary from this cancer protocol must be displayed in synoptic report format. Synoptic format is defined as:

- Data element: followed by its answer (response), outline format without the paired Data element: Response format is NOT considered synoptic.
- The data element should be represented in the report as it is listed in the case summary. The response for any data element may be modified from those listed in the case summary, including “Cannot be determined” if appropriate.
- Each diagnostic parameter pair (Data element: Response) is listed on a separate line or in a tabular format to achieve visual separation. The following exceptions are allowed to be listed on one line:
 - Anatomic site or specimen, laterality, and procedure
 - Pathologic Stage Classification (pTNM) elements
 - Negative margins, as long as all negative margins are specifically enumerated where applicable
- The synoptic portion of the report can appear in the diagnosis section of the pathology report, at the end of the report or in a separate section, but all Data element: Responses must be listed together in one location

Organizations and pathologists may choose to list the required elements in any order, use additional methods in order to enhance or achieve visual separation, or add optional items within the synoptic report. The report may have required elements in a summary format elsewhere in the report IN ADDITION TO but not as replacement for the synoptic report ie, all required elements must be in the synoptic portion of the report in the format defined above.

Summary of Changes**v 4.1.0.0**

- General Reformatting
- Revised Margins Section
- Revised Lymph Nodes Section
- Added Clinical Section
- Revised Tumor Site Section
- Added Tumor Sampling for Molecular Studies
- Added Discrete Tumor Deposits to Orbit
- Removed pTX and pNX Staging Classification
- Added Special Studies Section

Reporting Template

Protocol Posting Date: June 2021

Select a single response unless otherwise indicated.

CASE SUMMARY: (UVEAL MELANOMA)

Standard(s): AJCC-UICC 8

CLINICAL

+Treatment History

- ☐ No known preoperative therapy
- ☐ Preoperative therapy given (specify, if known): _____
- ☐ Not specified

SPECIMEN (Note [A](#))

Procedure (select all that apply)

- ☐ Local resection
- ☐ Enucleation
- ☐ Limited exenteration
- ☐ Complete exenteration
- ☐ Other (specify): _____
- ☐ Not specified

Tumor Sampling for Molecular Studies

- ☐ Yes
- ☐ No
- ☐ Not known

Specimen Laterality

- ☐ Right
- ☐ Left
- ☐ Not specified

TUMOR

Tumor Site (macroscopic examination / transillumination) (Note [B](#)) (select all that apply)

- ☐ Superotemporal quadrant of globe
- ☐ Superonasal quadrant of globe
- ☐ Inferotemporal quadrant of globe
- ☐ Inferonasal quadrant of globe
- ☐ Superior quadrant of globe
- ☐ Inferior quadrant of globe
- ☐ Nasal quadrant of globe
- ☐ Temporal quadrant of globe
- ☐ Anterior chamber
- ☐ Other (specify): _____
- ☐ Cannot be determined: _____

Tumor Site after Sectioning (Note C) (select all that apply)

- ☐ Supernasal
☐ Inferonasal
☐ Superotemporal
☐ Inferotemporal
☐ Superior quadrant of globe
☐ Inferior quadrant of globe
☐ Nasal quadrant of globe
☐ Temporal quadrant of globe

☐ Cannot be determined (explain): _____

+Regional Lymph Node Comment: _____

DISTANT METASTASIS**Distant Site(s) Involved, if applicable**

- ☐ Not applicable
☐ Specify site(s): _____

Largest Diameter of Largest Distant Metastasis

- ☐ Specify in Centimeters (cm): _____ cm
☐ Less than or equal to 3 cm
☐ 3.1 to 8.0 cm
☐ Greater than or equal to 8.1 cm
☐ Cannot be determined: _____
☐ Cannot be determined: _____

PATHOLOGIC STAGE CLASSIFICATION (pTNM, AJCC 8th Edition) (Note [F](#))

Reporting of pT, pN, and (when applicable) pM categories is based on information available to the pathologist at the time the report is issued. As per the AJCC (Chapter 1, 8th Ed.) it is the managing physician's responsibility to establish the final pathologic stage based upon all pertinent information, including but potentially not limited to this pathology report.

TNM Descriptions (select all that apply)

- ☐ Not applicable
☐ m (multiple primary tumors)
☐ r (recurrent)
☐ y (post-treatment)

pT Category

- ☐ pT not assigned (cannot be determined based on available pathological information)
☐ pT0: No evidence of primary tumor

Iris

pT1: Tumor limited to the iris

- ☐ pT1a: Tumor limited to the iris not more than 3 clock hours in size

- ___ pT1b: Tumor limited to the iris more than 3 clock hours in size
- ___ pT1c: Tumor limited to the iris with secondary glaucoma
- ___ pT1 (subcategory cannot be determined)
- pT2: Tumor confluent with or extending into the ciliary body, choroid, or both*
- ___ pT2a: Tumor confluent with or extending into the ciliary body, without secondary glaucoma
- ___ pT2b: Tumor confluent with or extending into the ciliary body and choroid, without secondary glaucoma
- ___ pT2c: Tumor confluent with or extending into the ciliary body, choroid, or both, with secondary glaucoma
- ___ pT2 (subcategory cannot be determined)
- ___ pT3: Tumor confluent with or extending into the ciliary body, choroid, or both, with scleral extension
- pT4: Tumor with extrascleral extension*
- ___ pT4a: Tumor with extrascleral extension less than or equal to 5 mm in largest diameter
- ___ pT4b: Tumor with extrascleral extension greater than 5 mm in largest diameter
- ___ pT4 (subcategory cannot be determined)

Iris melanomas originate from, and are predominantly located in, this region of the uvea. If less than half the tumor volume is located within the iris, the tumor may have originated in the ciliary body, and consideration should be given to classifying it accordingly.

Ciliary Body and Choroid

pT1: Tumor size category 1

- ___ pT1a: Tumor size category 1 without ciliary body involvement and extraocular extension
- ___ pT1b: Tumor size category 1 with ciliary body involvement
- ___ pT1c: Tumor size category 1 without ciliary body involvement but with extraocular extension less than or equal to 5 mm in largest diameter
- ___ pT1d: Tumor size category 1 with ciliary body involvement and extraocular extension less than or equal to 5 mm in largest diameter
- ___ pT1 (subcategory cannot be determined)

pT2: Tumor size category 2

- ___ pT2a: Tumor size category 2 without ciliary body involvement and extraocular extension
- ___ pT2b: Tumor size category 2 with ciliary body involvement
- ___ pT2c: Tumor size category 2 without ciliary body involvement but with extraocular extension less than or equal to 5 mm in largest diameter
- ___ pT2d: Tumor size category 2 with ciliary body involvement and extraocular extension less than or equal to 5 mm in largest diameter
- ___ pT2 (subcategory cannot be determined)

pT3: Tumor size category 3

- ___ pT3a: Tumor size category 3 without ciliary body involvement and extraocular extension
- ___ pT3b: Tumor size category 3 with ciliary body involvement
- ___ pT3c: Tumor size category 3 without ciliary body involvement but with extraocular extension less than or equal to 5 mm in largest diameter
- ___ pT3d: Tumor size category 3 with ciliary body involvement and extraocular extension less than or equal to 5 mm in largest diameter
- ___ pT3 (subcategory cannot be determined)

pT4: Tumor size category 4

- ___ pT4a: Tumor size category 4 without ciliary body involvement and extraocular extension
- ___ pT4b: Tumor size category 4 with ciliary body involvement
- ___ pT4c: Tumor size category 4 without ciliary body involvement but with extraocular extension less than or equal to 5 mm in largest diameter
- ___ pT4d: Tumor size category 4 with ciliary body involvement and extraocular extension less than or equal to 5 mm in largest diameter
- ___ pT4e: Any tumor size category with extraocular extension greater than 5 mm in largest diameter
- ___ pT4 (subcategory cannot be determined)

Primary ciliary body and choroidal melanomas are classified according to the four tumor size categories defined in Figure 3 (CAP Cancer Protocol Explanatory Notes).

In clinical practice, the largest tumor basal diameter may be estimated in optic disc diameters (DD; average: 1 DD = 1.5 mm), and tumor thickness may be estimated in diopters (average: 2.5 diopters = 1 mm). Ultrasonography and fundus photography are used to provide more accurate measurements.

When histopathologic measurements are recorded after fixation, tumor diameter and thickness may be underestimated because of tissue shrinkage.

pN Category

☐ pN not assigned (no nodes submitted or found)

☐ pN not assigned (cannot be determined based on available pathological information)

☐ pN0: No regional lymph node metastasis

pN1: Regional lymph node metastasis or discrete tumor deposits in the orbit

☐ pN1a: Metastasis in one or more regional lymph node(s)

☐ pN1b: No regional lymph nodes are positive, but there are discrete tumor deposits in the orbit that are not contiguous to the eye (choroidal and ciliary body)

☐ pN1 (subcategory cannot be determined)

pM Category (required only if confirmed pathologically)

☐ Not applicable - pM cannot be determined from the submitted specimen(s)

pM1: Distant metastasis

☐ pM1a: Largest diameter of the largest metastasis less than or equal to 3 cm

☐ pM1b: Largest diameter of the largest metastasis 3.1-8.0 cm

☐ pM1c: Largest diameter of the largest metastasis greater than or equal to 8.1 cm

☐ pM1 (subcategory cannot be determined)

ADDITIONAL FINDINGS (Note [G](#))

+Additional Findings (select all that apply)

☐ None identified

☐ Mitotic rate (number of mitoses per 40 fields determined by using a 40X objective with a field area of 0.152 mm²) (specify): _____ mitoses per 40 high-power fields (HPF)

☐ Vasculogenic mimicry patterns (extracellular closed loops and networks, the latter defined as at least 3 back-to-back closed loops, is associated with death from metastatic disease)

☐ Vascular invasion (tumor vessels or other vessels)

☐ Degree of pigmentation (specify): _____

☐ Tumor infiltrating lymphocytes

☐ Tumor infiltrating macrophages

☐ Drusen

☐ Retinal detachment

☐ Rupture of Bruch's membrane

☐ Nevus

☐ Hemorrhage (specify site): _____

☐ Neovascularization

☐ Other (specify): _____

SPECIAL STUDIES

+Gene Expression Profile (GEP)

☐ Class 1A

☐ Class 1B

☐ Class 2

+TCGA Classification

- ☐ Group A
- ☐ Group B
- ☐ Group C
- ☐ Group D

+BAP1 Result by Immunohistochemistry

- ☐ Intact nuclear expression
- ☐ Loss of nuclear expression
- ☐ Cannot be determined (explain): _____

+BAP1 Mutational Analysis

- ☐ No mutation detected
- ☐ Mutation(s) identified: _____

+PRAME Expression Status

- ☐ Positive
- ☐ Negative

COMMENTS

Comment(s): _____

Explanatory Notes

A. Fixative

The minimum recommended fixation time for whole globes with intraocular tumors is 24 to 48 hours. The globe should be fixed in an adequate volume of fixative, with a 10:1 ratio of fixative volume to specimen volume recommended. Incisions or windows in the globe are not necessary for adequate penetration of fixative and are not recommended. Injection of fixative into the globe is also not recommended.

B. Orientation

The orientation of a globe may be determined by identification of extraocular muscle insertions, the optic nerve, and other landmarks, as illustrated in Figure 1. The terms temporal and nasal are generally used in place of lateral and medial with reference to ocular anatomy.

Figure 1. Anatomic landmarks of the posterior aspect of the globe (right eye). The position of the inferior oblique muscle relative to the optic nerve is most helpful in orienting the globe. The inferior oblique muscle insertion is located temporal (lateral) to the optic nerve on the sclera, and its fibers travel inferonasally from its insertion. The long posterior ciliary artery is often seen as a blue-gray line in the sclera on either side of the optic nerve and marks the horizontal meridian of the globe. Reprinted with permission from WB Saunders Company.

C. Sectioning the Globe

The globe is generally sectioned in the meridian to include the largest (or the most informative) portion of the tumor, with care to include the pupil and optic nerve in the section to be submitted for microscopic examination, as illustrated in Figure 2. Alternative methods of sectioning have been described.^{[1,2,3](#)}

Figure 2. The most common methods of sectioning a globe. After transillumination, the tumor base is marked, if possible, and included in the pupil-optic (p-o) nerve section and submitted for processing. If tumor is found in either of the calottes, these may also be submitted for sectioning. The meridian in which the globe was sectioned should be included in the gross description of the pathology report. It is not uncommon to induce an artifactual retinal detachment while sectioning the globe. This can be minimized by gentle handling and by avoiding a sawing motion with the blade. When a scleral window has been created to retrieve fresh tumor, this window should be included in one of the calottes to allow for an intact PO section. Reprinted with permission from WB Saunders Company.

D. Tumor Size

Tumor greatest basal diameter is measured as the greatest arc of contact of the tumor base with the sclera. The tumor height is measured perpendicular to the sclera from the base of the tumor to its apex. See Figure 3. Tumor size can be also measured on a microscopic slide in accordance with the same guidelines. In general, the largest dimensions (either gross or microscopic) are recorded for T category.¹

Figure 3. The dotted red line designates the measurement of largest basal diameter. The dotted black line designates the measurement of apical height. Courtesy of Ralph C. Eagle, Jr. M.D.

Tumor size has prognostic significance. Many studies of choroidal and ciliary body melanoma have defined small tumors as being less than 10 mm in greatest diameter.² More recently, an ongoing study started in 1986, the Collaborative Ocular Melanoma Study,^{3,4} defined the following size classification based on clinical measurements.

Small tumors#:	Smaller than medium or large tumors defined below
Medium tumors:	Greater than or equal to 2.5 mm, less than or equal to 10 mm in height, and less than or equal to 16 mm in basal diameter
Large tumors:	Greater than 10 mm in height or Greater than 2 mm in height and greater than 16 mm in basal diameter or Greater than 8 mm in height with optic nerve involvement

#Small tumors have a more favorable prognosis.^{5,6}

Since then, the AJCC TNM system defined empirically 4 tumor sizes (Figure 3) – small (T1), medium (T2), large (T3), and very large (T4) – that differ significantly in survival prognosis.^{7,8} This size classification was externally validated and is now recommended.

E. Histologic Type

The modified Callender classification shown below is used for determining cell type but has prognostic significance only for tumors of the choroid and ciliary body, not those of the iris, which generally have a benign course unless they invade the chamber angle.^{1,2,3,4,5,6} The American Joint Committee on Cancer (AJCC) defined the histopathologic types[#] as follows⁴:

Spindle cell melanoma	(>90% spindle cells)
Mixed cell melanoma	(>10% epithelioid cells and <90% spindle cells)
Epithelioid cell melanoma	(>90% epithelioid cells)

[#]Spindle cell melanomas have the most favorable prognosis, and epithelioid cell melanomas the least favorable in terms of survival.

Histologic Grade (G)

G	G Definition
GX	Grade cannot be assessed
G1	Spindle cell melanoma (>90% spindle cells)
G2	Mixed cell melanoma (>10% epithelioid cells and <90% spindle cells)
G3	Epithelioid cell melanoma (>90% epithelioid cells)
Note: Because of the lack of universal agreement regarding which proportion of epithelioid cells classifies a tumor as mixed or epithelioid, some ophthalmic pathologists currently combine grades 2 and 3 (nonspindle, ie, epithelioid cells detected) and contrast them with grade 1 (spindle, ie, no epithelioid cells detected) or even tumors that have no epithelioid cells with those that have any epithelioid cells.

F. Pathologic Stage Classification

The American Joint Committee on Cancer (AJCC) and the International Union Against Cancer (UICC) TNM staging systems for uveal melanoma of the iris, ciliary body, and choroid are shown below.¹

By AJCC/UICC convention, the designation “T” refers to a primary tumor that has not been previously treated. The symbol “p” refers to the pathologic classification of the TNM, as opposed to the clinical classification, and is based on gross and microscopic examination. pT entails a resection of the primary tumor or biopsy adequate to evaluate the highest pT category, pN entails removal of nodes adequate to validate lymph node metastasis, and pM implies microscopic examination of distant lesions. Clinical classification (cTNM) is usually carried out by the referring physician before treatment during initial evaluation of the patient or when pathologic classification is not possible.

Pathologic staging is usually performed after surgical resection of the primary tumor. Pathologic staging depends on pathologic documentation of the anatomic extent of disease, whether or not the primary tumor has been completely removed. If a biopsied tumor is not resected for any reason (eg, when technically unfeasible) and if the highest T and N categories or the M1 category of the tumor can be confirmed microscopically, the criteria for pathologic classification and staging have been satisfied without total removal of the primary cancer.

TNM Descriptors

For identification of special cases of TNM or pTNM classifications, the “m” suffix and “y,” “r,” and “a” prefixes are used. Although they do not affect the stage grouping, they indicate cases needing separate analysis.

The “m” suffix indicates the presence of multiple primary tumors in a single site and is recorded in parentheses: pT(m)NM.

The “y” prefix indicates those cases in which classification is performed during or following initial multimodality therapy (ie, neoadjuvant chemotherapy, radiation therapy, or both chemotherapy and radiation therapy). The cTNM or pTNM category is identified by a “y” prefix. The ycTNM or ypTNM categorizes the extent of tumor actually present at the time of that examination. The “y” categorization is not an estimate of tumor prior to multimodality therapy (ie, before initiation of neoadjuvant therapy).

The “r” prefix indicates a recurrent tumor when staged after a documented disease-free interval, and is identified by the “r” prefix: rTNM.

The “a” prefix designates the stage determined at autopsy: aTNM.

Additional Descriptors

Residual Tumor (R)

Tumor remaining in a patient after therapy with curative intent (eg, surgical resection for cure) is categorized by a system known as R classification, shown below:

RX	Presence of residual tumor cannot be assessed
R0	No residual tumor
R1	Microscopic residual tumor
R2	Macroscopic residual tumor

For the surgeon, the R classification may be useful to indicate the known or assumed status of the completeness of a surgical excision. For the pathologist, the R classification is relevant to the status of the margins of a surgical resection specimen. That is, tumor involving the resection margin on pathologic examination may be assumed to correspond to residual tumor in the patient and may be classified as macroscopic or microscopic according to the findings at the specimen margin(s).

T Category Considerations

Iris melanomas originate from, and are predominantly located in, this region of the uvea. If less than half of the tumor volume is located within the iris, the tumor may have originated in the ciliary body, and consideration should be given to classifying it accordingly.

Ciliary Body and Choroid

Primary ciliary body and choroidal melanomas are classified according to the 4 tumor size categories below¹:

Thickness (mm)							
>15					4	4	4
12.1-15.0				3	3	4	4
9.1-12.0		3	3	3	3	3	4
6.1-9.0	2	2	2	2	3	3	4
3.1-6.0	1	1	1	2	2	3	4
≤ 3.0	1	1	1	1	2	2	4
	≤ 3.0	3.1-6.0	6.1-9.0	9.1-12.0	12.1-15.0	15.1-18.0	>18

Largest basal diameter (mm)

Figure 3. In clinical practice, the largest tumor basal diameter may be estimated in optic disc diameters (dd, average: 1 dd = 1.5 mm). Tumor thickness may be estimated in diopters (average: 2.5 diopters = 1 mm). However, techniques such as ultrasonography and fundus photography are used to provide more accurate measurements. Ciliary body involvement can be evaluated by the slit-lamp, ophthalmoscopy, gonioscopy, and transillumination. However, high-frequency ultrasonography (ultrasound biomicroscopy) is used for more accurate assessment. Extension through the sclera is evaluated visually before and during surgery, and with ultrasonography, computed tomography, or magnetic resonance imaging.

When histopathologic measurements are recorded after fixation, tumor diameter and thickness may be underestimated because of tissue shrinkage.

Lymph-Vascular Invasion (LVI)

LVI indicates whether microscopic lymph-vascular invasion is identified in the pathology report. LVI includes lymphatic invasion, vascular invasion, or lymph-vascular invasion. By AJCC/UICC convention, LVI does not affect the T category indicating local extent of tumor unless specifically included in the definition of a T category. It should be noted that regional lymph node involvement is rare in uveal melanoma, but metastasis to the liver and direct extension into the orbit are more common.¹

Stage Grouping

Stage I	T1a	N0	M0
Stage IIA	T1b-d	N0	M0
	T2a	N0	M0
Stage IIB	T2b	N0	M0
	T3a	N0	M0
Stage IIIA	T2c-d	N0	M0
	T3b-c	N0	M0
	T4a	N0	M0
Stage IIIB	T3d	N0	M0
	T4b-c	N0	M0
Stage IIIC	T4d-e	N0	M0
Stage IV	Any T	N1	M0
	Any T	Any N	M1a-c

G. Other Pathologic Features of Prognostic Significance

Other histologic features with prognostic significance in choroidal and ciliary body melanoma include the number of mitoses in 40 high-powered fields, pigmentation, tumor infiltrating lymphocytes, tumor infiltrating macrophages, growth pattern (diffuse choroidal melanomas and ring melanomas of the ciliary body have a much less favorable prognosis), location of anterior margin of tumor, degree and patterns of vascularity, blood vessel invasion (both tumor vessels and normal vessels), tumor necrosis, extraocular extension, optic nerve involvement, and lack of nuclear BAP1 immunostaining.
