Protocol for the Examination of TURP Specimens From Patients With Carcinoma of the Prostate Gland

Version: ProstateTURP 4.0.4.0  Protocol Posting Date: February 2019

Accreditation Requirements
The use of this protocol is recommended for clinical care purposes but is not required for accreditation purposes.

This protocol may be used for the following procedures AND tumor types:

<table>
<thead>
<tr>
<th>Procedure</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TURP</td>
<td>Includes specimens designated transurethral resection of the prostate (TURP), and enucleation specimens (subtotal prostatectomy)</td>
</tr>
<tr>
<td>Tumor Type</td>
<td>Description</td>
</tr>
<tr>
<td>Carcinoma</td>
<td>Includes all adenocarcinomas and histologic variants, neuroendocrine carcinomas, and others</td>
</tr>
</tbody>
</table>

The following should NOT be reported using this protocol:

<table>
<thead>
<tr>
<th>Procedure</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Biopsy (consider Prostate Biopsy protocol)</td>
<td></td>
</tr>
<tr>
<td>Radical Prostatectomy (consider Prostate Radical Prostatectomy protocol)</td>
<td></td>
</tr>
<tr>
<td>Tumor Type</td>
<td>Description</td>
</tr>
<tr>
<td>Urothelial tumor, including variants (consider the Urethra (prostatic urethra) protocol)</td>
<td></td>
</tr>
<tr>
<td>Lymphoma (consider the Hodgkin or non-Hodgkin Lymphoma protocols)</td>
<td></td>
</tr>
<tr>
<td>Sarcoma (consider the Soft Tissue protocol)</td>
<td></td>
</tr>
</tbody>
</table>

CAP Prostate Protocol Summary of Changes

Version 4.0.4.0
Separate TURP case summary document
Modified Grade Group and Gleason Score reporting format
Surgical Pathology Cancer Case Summary

Protocol posting date: February 2019

PROSTATE GLAND: Transurethral Prostatic Resection (TURP), Enucleation Specimen (Subtotal Prostatectomy)

Note: This case summary is recommended for reporting TURP specimens but is NOT REQUIRED for accreditation purposes. Core data elements are bolded to help identify routinely reported elements.

Select a single response unless otherwise indicated.

Procedure (Note A)
___ Transurethral resection of the prostate (TURP)
___ Enucleation (subtotal prostatectomy)
___ Other (specify): _____________________________
___ Not specified

Histologic Type (select all that apply) (Note B)
___ Acinar adenocarcinoma
___ Ductal adenocarcinoma
___ Small-cell neuroendocrine carcinoma
___ Isolated intraductal carcinoma
___ Other histologic type not listed (specify): __________________________

Histologic Grade (Note C)
Grade Group and Gleason Score
___ Not applicable
___ Cannot be assessed
___ Grade group 1 (Gleason Score 3+3=6)
___ Grade group 2 (Gleason Score 3+4=7)
___ Grade group 3 (Gleason Score 4+3=7)
___ Grade group 4 (Gleason Score 4+4=8)
___ Grade group 4 (Gleason Score 3+5=8)
___ Grade group 4 (Gleason Score 5+3=8)
___ Grade group 5 (Gleason Score 4+5=9)
___ Grade group 5 (Gleason Score 5+4=9)
___ Grade group 5 (Gleason Score 5+5=10)

Percentage of Pattern 4 in Gleason Score 7(3+4, 4+3) Cancer (report if applicable) ____%

Percentage Gleason Patterns 4 and 5 (applicable to Gleason score greater than 7)
Percentage pattern 4: ____%
Percentage pattern 5: ____%

Intraductal Carcinoma (IDC) (Note D)
___ Not identified
___ Present
___ Cannot be determined
Tumor Quantitation (Note E)

**For TURP Specimens**
Number of positive chips: ____
Total number of chips: ____
Cannot be determined

and

Estimated percentage of prostatic tissue involved by tumor: ____%
Percentage of tumor in each chip: ____%

**For Enucleation and Other Specimens**
Estimated percentage of prostatic tissue involved by tumor: ____%

Tumor size (dominant nodule, if present):
  Greatest dimension (millimeters): ___ mm
  Additional dimensions (millimeters): ___ x ___ mm

Periprostatic Fat Invasion (report if identified in specimen)
  Not identified
  Present

Seminal Vesicle Invasion (report if identified in specimen)
  Not identified
  Present

Lymphovascular Invasion
  Not identified
  Present
  Cannot be determined

Perineural Invasion (Note F)
  Not identified
  Present

Additional Pathologic Findings (select all that apply)
  None identified
  High-grade prostatic intraepithelial neoplasia (PIN) (Note G)
  Atypical adenomatous hyperplasia (adenosis)
  Nodular prostatic hyperplasia
  Inflammation (specify type): ___________________________
  Other (specify): ___________________________

Treatment Effect (select all that apply)
  No known presurgical therapy
  Not identified
  Radiation therapy effect present
  Hormonal therapy effect present
  Other therapy effect(s) present (specify): ____________________
  Cannot be determined

Comment(s)
Explanatory Notes

A. Submission of Tissue for Microscopic Evaluation in Transurethral Resection

Transurethral resection specimens that weigh 12 grams or less should be submitted in their entirety, usually in 6 to 8 cassettes. For specimens that weigh more than 12 g, the initial 12 g are submitted (6-8 cassettes), and 1 cassette may be submitted for every additional 5 g of remaining tissue. In general, random chips are submitted; however, if some chips are firmer or have a yellow or orange-yellow appearance, they should be submitted preferentially.

If an unsuspected carcinoma is found in tissue submitted, and it involves 5% or less of the tissue examined, the remaining tissue may be submitted for microscopic examination, especially in younger patients.

B. Histologic Type

This protocol applies only to invasive adenocarcinomas of the prostate gland, as shown below. Carcinomas other than adenocarcinoma are exceptionally uncommon, accounting for less than 0.5% of prostatic tumors. The protocol does not apply to pure squamous cell carcinoma, basal cell carcinoma, urothelial carcinoma, small cell neuroendocrine carcinoma, and large cell neuroendocrine carcinoma. If these rare subtypes of carcinoma, however, are mixed with acinar type adenocarcinoma, the protocol may be used.

Classification of Invasive Adenocarcinoma of Prostate (2016 WHO classification1)

Acinar adenocarcinoma
- Atrophic
- Pseudohyperplastic
- Microcystic
- Foamy gland
- Mucinous (colloid)
- Signet ring-like cell
- Pleomorphic giant cell
- Sarcomatoid

Ductal adenocarcinoma
- Cribriform
- Papillary
- Solid

Neuroendocrine tumors
- Adenocarcinoma with neuroendocrine differentiation
- Well-differentiated neuroendocrine tumor
- Small-cell neuroendocrine carcinoma
- Large cell neuroendocrine carcinoma

C. Histologic Grade

Gleason Score
The Gleason grading system is recommended for use in all prostatic specimens containing adenocarcinoma, with the exception of those showing treatment effects, usually in the setting of androgen withdrawal and radiation therapy. The Gleason score is an important parameter used in nomograms, such as the Kattan nomograms, and the Partin tables, which guide individual treatment decisions. Readers are referred to the recommendations of 2 ISUP consensus conferences dealing with the contemporary usage of the Gleason system (also see Figure 1). The Gleason score is the sum of the primary (most predominant in terms of surface area of involvement) Gleason grade and the secondary (second most predominant) Gleason grade. Where no secondary Gleason grade exists, the primary Gleason grade is doubled to arrive at a Gleason score. The primary and secondary grades should be reported in addition to the Gleason score, that is, Gleason score 7(3+4) or 7(3+4). In needle biopsy specimens, Gleason score is the sum of the primary (most predominant) Gleason grade and highest Gleason grade.

Figure 1. 2015 modified ISUP Gleason schematic diagram.

In TURP specimens, where there is a minor secondary component (less than 5% of tumor) and where the secondary component is of higher grade, the latter should be reported. For instance, a case showing more than 95% Gleason pattern 3 and less than 5% Gleason pattern 4 should be reported as Gleason score 7(3+4). Conversely, if a minor secondary pattern is of lower grade, it need not be reported. For instance, where there is greater than 95% Gleason pattern 4 and less than 5% Gleason pattern 3, the score should be reported as Gleason score 8(4+4).

In TURP specimens where more than 2 patterns are present, and the worst grade is neither the predominant nor the secondary grade, the predominant and highest grade should be chosen to arrive at a score (eg, 75% pattern 3, 20-25% pattern 4, less than 5% pattern 5 is scored as 3+5=8). This approach has been validated in a large clinical series. The above rules apply to both specimen-level and case-level reporting.
Grade Group
The 9 Gleason scores (2-10) have been variably lumped into different groups for prognosis and patient management purposes. Epstein and associates proposed grouping scores into 5 prognostic categories, grade groups 1-5. This grade grouping, shown below in the table, strongly correlate with biochemical recurrence and have been incorporated into the new Partin tables. At the 2014 ISUP Consensus Conference, details of this prognostic system were clarified and it was recommended for usage together with the Gleason system. This grade grouping has also been subsequently validated by other independent studies in surgical and radiation cohorts show significant correlation with survival. The new grade grouping has been endorsed in the 2016 WHO classification.

The grade grouping has also been endorsed by ISUP and is referred to as ISUP grade in some publications. Like Gleason scoring in needle biopsies, the grade group can be applied at core, specimen, or case levels.

Table: Grade Groups

<table>
<thead>
<tr>
<th>Grade Group</th>
<th>Gleason Score</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Less than or equal to 6</td>
<td>Only individual discrete well-formed glands</td>
</tr>
<tr>
<td>2</td>
<td>3+4=7</td>
<td>Predominantly well-formed glands with lesser component of poorly formed/fused/cribriform glands</td>
</tr>
<tr>
<td>3</td>
<td>4+3=7</td>
<td>Predominantly poorly formed/fused/cribriform glands with lesser component (*) of well-formed glands</td>
</tr>
<tr>
<td>4</td>
<td>4+4=8</td>
<td>Only poorly formed/fused/cribriform glands</td>
</tr>
<tr>
<td></td>
<td>3+5=8</td>
<td>Predominantly well-formed glands and lesser component (##) lacking glands (or with necrosis)</td>
</tr>
<tr>
<td></td>
<td>5+3=8</td>
<td>Predominantly lacking glands (or with necrosis) and lesser component (##) of well-formed glands</td>
</tr>
<tr>
<td>5</td>
<td>9-10</td>
<td>Lack gland formation (or with necrosis) with or without poorly formed/fused/cribriform glands (*)</td>
</tr>
</tbody>
</table>

* For cases with greater than 95% poorly formed/fused/cribriform glands on a core or at radical prostatectomy, the component of less than 5% well-formed glands is not factored into the grade; should therefore be graded as grade group 4.

** Poorly formed/fused/cribriform glands can be a more minor component.

Percentage Gleason patterns 4 and 5 (Applicable to Gleason Scores ≥7)
Another recommendation from the 2014 ISUP consensus conference endorsed in the 2016 WHO classification is that the percentage of pattern 4 should be recorded in all Gleason score 7(3+4, 4+3) cases. This measurement further stratifies Gleason score 7 and allows identification of cases with limited pattern 4 (eg, less than 10%) or extensive pattern 4 (eg, greater than 75%). This has practical importance since selected patients with Gleason score 7(3+4) but small amounts of pattern 4 (less than or equal to 10%) may be eligible for active surveillance.

In tumors with Gleason scores greater than 7, the percentage of patterns 4 and 5 has been shown to be of prognostic significance and may be included in the report. Currently there is no consensus on how the percentage of pattern 4+5 should be recorded although it may be captured in 10% intervals or other stratifications such as less than 5%, 5%-10%, 10%-25%, 25%-50%, 50%-75%, greater than 75%.

D. Intraductal Carcinoma (IDC)

The presence of intraductal carcinoma (IDC) is important to record since it has independent prognostic significance. Intraductal carcinoma is uncommon in needle biopsies and when present is usually found within invasive tumor. 1-3 It is important to distinguish IDC from high-grade prostatic intraepithelial neoplasia. The differential diagnosis of IDC is beyond the scope of this protocol.
Intraductal carcinoma may also be recorded in TURP specimens. IDC is in needle biopsies is strongly associated with high Gleason score and high volume tumor in radical prostatectomies and with metastatic disease. At the 2014 ISUP consensus conference, it was agreed that Gleason scores or grade groups (ISUP grades) should not be assigned to IDC.

E. Quantitation of Tumor
Studies have shown prostate cancer volume is a prognostic factor, although the data are conflicting as to its independent prognostic significance.
The designation of the percentage of cancer tissue in transurethral samples is important. When prostate cancer is discovered incidentally (ie, discovered in specimens submitted for clinically benign disease, usually benign prostatic hyperplasia [BPH]), the percentage involvement is used to determine the clinical T1 stage, with less than or equal to 5% involvement being T1a and greater than 5% being T1b. In subtotal and radical prostatectomy specimens, the percentage of tissue involved by tumor can also be "eyeballed" by simple visual inspection. Additionally, in these latter specimens, it may be possible to measure a dominant tumor nodule in at least 2 dimensions and/or to indicate the number of blocks involved by tumor out of the total number of prostatic blocks submitted.

F. Perineural Invasion

Perineural invasion in core needle biopsies has been associated with extraprostatic extension in some correlative radical prostatectomy studies, although its exact prognostic significance remains unclear.1-4 Perineural invasion has been found to be an independent risk factor, in some studies, for predicting an adverse outcome in patients treated with external beam radiation,56 but not for patients treated with brachytherapy or radical prostatectomy.5 The value of perineural invasion as an independent prognostic factor has been questioned in a multivariate analysis.4 Presence of perineural invasion may also be reported in TURP specimens.

G. Prostatic Intraepithelial Neoplasia

The diagnostic term prostatic intraepithelial neoplasia (PIN), unless qualified, refers to high-grade PIN. Low-grade PIN is not reported. The presence of an isolated PIN (PIN in the absence of carcinoma) should be reported in TURP specimens.1 High-grade PIN in a biopsy without evidence of carcinoma has in the past been a risk factor for the presence of carcinoma on subsequent biopsies, but the magnitude of the risk has diminished, and, in some studies, high-grade PIN was not a risk factor at all.2,3 More recent data suggests that if high-grade PIN is present in 2 or more sites, there is an increased risk of detecting carcinoma in subsequent biopsies.4,5
